TITLE: Electrochemical vibration meter

SOURCE: Izmeritel'naya tekhnika, no. 4, 1966, 23-24

TOPIC TAGS: vibration measurement electrochemistry

ABSTRACT: The article describes the newly developed type EKhV-1 vibration meter with an electrochemical transformer. It can be used for measuring the rate of vibrations of a magnitude from 0.1 to 3 meters per second, in the frequency range from 10 to 200 cycles. The transformer consists of a plastic body sealed by plastic membranes. The electrodes are made of platinum foil and are located in the middle section of the body, separated by a glass fabric. A solution of ferri- and ferrocyanide and the chemically inert platinum electrodes form an oxidation-reduction system. The reactions are:

on the cathode: $[Fe(CN)_6]^{3-} + 1e \rightarrow [Fe(CN)_6]^{4-}$;

on the anode: $[Fe(CN)_6]^{4-} - 1e \rightarrow [Fe(CN)_6]^{3-}$.

AUTHOR: Bol'berg, A.F.

TITLE: On the mixed problem for some parabolic systems

PERIODICAL: Referativnyy zhurnal. Matematika, no. 4, 1961, 54,
abstract 4 B 263. ("Uch. zap. Leningr. gos. ped. in-ta im.
A.I. Gertsena", 1958, 183, 59-84)TEXT: In the region $Q (0 < t < T, \gamma_1(t) < x < \gamma_2(t))$ of the (t, x) -plane the author considers the parabolic system

$$\frac{\partial^2 u}{\partial t^2} + A(t) \frac{\partial^3 u}{\partial x^2 \partial t} + B(t) \frac{\partial^4 u}{\partial x^4} + \text{terms of lower order} = 0, \quad (1)$$

where $A(t)$, $B(t)$ etc. are quadratic matrices and $u = u(t, x)$ is the unknown vector function. For this system the author solves the first boundary value problem with the initial and boundary conditions

$$u|_{t=0} = u'_t|_{t=0} = 0,$$

Card 1/2

On the mixed problem for some

26505
S/044/61/000/004/017/033
C111/C222

$$u|_{x=\psi_i(t)} = \psi_i(t), \quad \frac{\partial u}{\partial x}|_{x=\psi_i(t)} = \psi_i'(t) \quad (i=1,2) \quad . \quad (2)$$

Under certain assumptions the problem (1)-(2) leads to a system of integral equations of Volterra's type which is solvable if the matrices $A(t)$ and $B(t)$ are exchangeable.

Title : Experimental Data Regarding Temporary Colonies Organized with Queens which Hibernated Outside of Winter Quarters

Orig Pub : Apicultura, 1957, No 6, 4-9

Abstract : The method of using auxiliary queens (AQ) during productive years resulted in a 35-130 percent increase of honey being collected in Rumania. In unproductive years, the increase amounted only to 12-18 percent, for a considerable part of honey crops had to be spent for bee colonies for the period of their hibernating with AQ. A new method of hibernating of queens outside of winter-quarters is proposed. During spring, one or more temporary colonies (TC) are organized from a strong basic colony (BC) with queens which hibernated

Card : 1/2

RUMANIA/Farm Animals. Honeybees

Q-6

Abs Jour : Ref Zhur - Biol., No 11, 1958, No 50118

outside of winter quarters. At the onset of winter season, TC are united with BC. An equal number of BC and TC was formed from 58 bee colonies at 3 experimental stations in Rumania in April of 1955. TC were supplied with queens which hibernated outside of winter quarters. For the winter season of 1955/1956 the abovementioned combined colonies weighing 3-5 kg were used; here, the winter bee losses were lower by 140 percent than in control colonies. The feed requirements were lower by 2.5 kg per each kg of bees in test colonies as compared to control colonies. When 2 TC were formed from each BC in another experiment, a total crop of 122.5 kg of honey was obtained (90.4 kg being a commercial quality), while only 24.8 kg of commercial quality honey could be obtained from control bees. In another experiment, involving one of the TC, 62.4 kg of commercial quality honey were collected. --V.A. Kanzyuba

Title : The Effectiveness of Migratory Apiculture.

Orig Pub. : Apicultura, 1957, No 7, 4-8

Abstract : During the investigations of Rumanian experimental stations in 1953-1956, the results of transferring apiaries within various distances were compared. At first, migrations proved to be unprofitable; shipping costs per 1 kg of honey from a migratory apiary exceeded the costs from a control apiary by 18 times. In 1956, after collecting 19.1 kg from acacia trees, the experimental group collected on the average 15.4 kg per colony from linden trees

per sq. cm. The optimum moisture in peat, producing strongest briquets depends on the granulometric composition of peat and changes together with it. The temporary resistance to bending of briquets produced was 27 - 34 kg per sq.cm; 5% crumbs or more was produced, when briquets were dropped from a height of 3 m on a cement floor. The briquets disintegrated when immersed in water. In the extraction of peat with a mixture of alcohol and benzene (1 : 1), the yield of the extract varied between 3.8 and 18.5% of the combustible mass depending on the character of peat. ABSTRACT : As a result of laboratory studies of coking (at up to 1000°) of the briquetted Romanian raw coal from Turjeni mines (A = 10%, Vg = 43%) a possibility of obtaining cokes of good quality was established. This was achieved by means of using 15-20% of semi-coke (Ac=12.8%, Vg=16.9%) in the briquetting with the rate of temperature rise of 40 per minute while passing through the 400-700°

Abstract: In the two series of experiments, crushed lignite to a particle size of 0-0.02 mm was briquetted under the 1500 kg/cm² pressure. Effects of material's density, particle size composition, temperature, duration of heating, residence time in a matrix, and of briquetting pressure were investigated. The results of experiments conducted at 280-400° indicate that the water-resistance of briquetts increases throughout the temperature range and reaches the normal level at 350°, while the mechanical stability increases from 6 to 15 kg/cm² in the 280-320° temperature range, then it falls abruptly as temperature increases up to 400°, reaching 1.5 kg/cm². In the other series of tests,

TITLE	Study of the Gasification of Coke Under the Action of Carbon Dioxide
ORIG. PUB.	Studii si Cercetari Energ., 8, No 2, 243-255 (1958)
ABSTRACT	The authors have investigated the gasification of coke produced from Rumanian coals under the action of CO ₂ . The coke was heated in a metal tube of 80 mm diam in a stream of 99.6% CO ₂ at a temperature of 950° and a flow rate of 10 liters per hr. The gasification index was determined according to the formula $R = 100 \cdot CO(CO_2 + 0.5 \cdot CO)$ where R is expressed in terms of the volume of CO

TITLE: Application of induction heating for hardening surgical scalpels of steel EI-515.

PERIODICAL: Jemna mechanika a optika, no.11, 1962, 348-349

TEXT: This article appears to be an abridged version of an article originally published in Meditsinskaya promyshlennost' no.8, 1961, 49-52. Surgical scalpels are made primarily of steel EI-515 (composition C 1%, Cr 12-14.5%, Mo 1.5-1.8%, Si 0.35%, Mn 0.5-0.8%), which must be heat-treated to RC 58-62 to ensure satisfactory cutting properties and resistance to corrosion. The final quality depends to a great extent on the heat-treatment. The scalpels are h.f. hardened, using a 500-700 kc/s oscillator, 17.5 kW input, 8 kW output. The inductor must fit closely the complex shape of the blade; sketches of the most characteristic inductor shapes used in the experiments are shown in Fig.1. In the inductors a and b the blade temperature was not high enough and therefore its hardness was low, although the handle hardened to RC 60 and more. The

Card 1/3

Application of induction heating ...

Z/030/62/000/011/002/003
E073/E135

inductor c produced intensive and rapid heating. Inductors d, e and f enabled the handle to be heated as well as the blade but the temperature rise was nonuniform. In the inductor g both the blade and the handle heated up uniformly provided that during the heating process the scalpel was moved from the initial position in the short loop, where only the handle heated up, to the final position in the long loop where both the handle and the blade became heated. This movement was effected by a mechanism as shown in Fig. 2, where; 1 - high-frequency oscillator; 2 - inductor; 3 - asbestos-cement disc; 4 - base; 5 - handle for manual drive; 6 - wormgear transmission; 7 - motor. The disc 3 is 600 mm in diameter, 15 mm thick and contains grooves; it is able to carry 50 scalpels. These are moved into the inductor during rotation and become heated. Optimum quenching medium: 80% KOH, 20% NOH plus water (4-5% of the total weight of the melt) with a bath temperature 220-250 °C and a quenching time of 1 min. Compared to furnace-heated scalpels, the average hardness (59-61 RC) and the microhardness of induction-heated ones are somewhat higher but their impact strength is somewhat lower.

"The Resuscitation of the Newborn."

Zagreb, Lijecnicki Vjesnik, Vol 85, No 4, April 1963, pp
444-446.

Abstract: The author reviews recent British and US literature on the subject (10 references) and concludes that obstetricians and pediatricians are not of one mind as to the proper method of resuscitation because the infant's lungs must first be expanded and then ventilated and because excessively strong insufflation can cause rupture of the lungs or pneumothorax.
